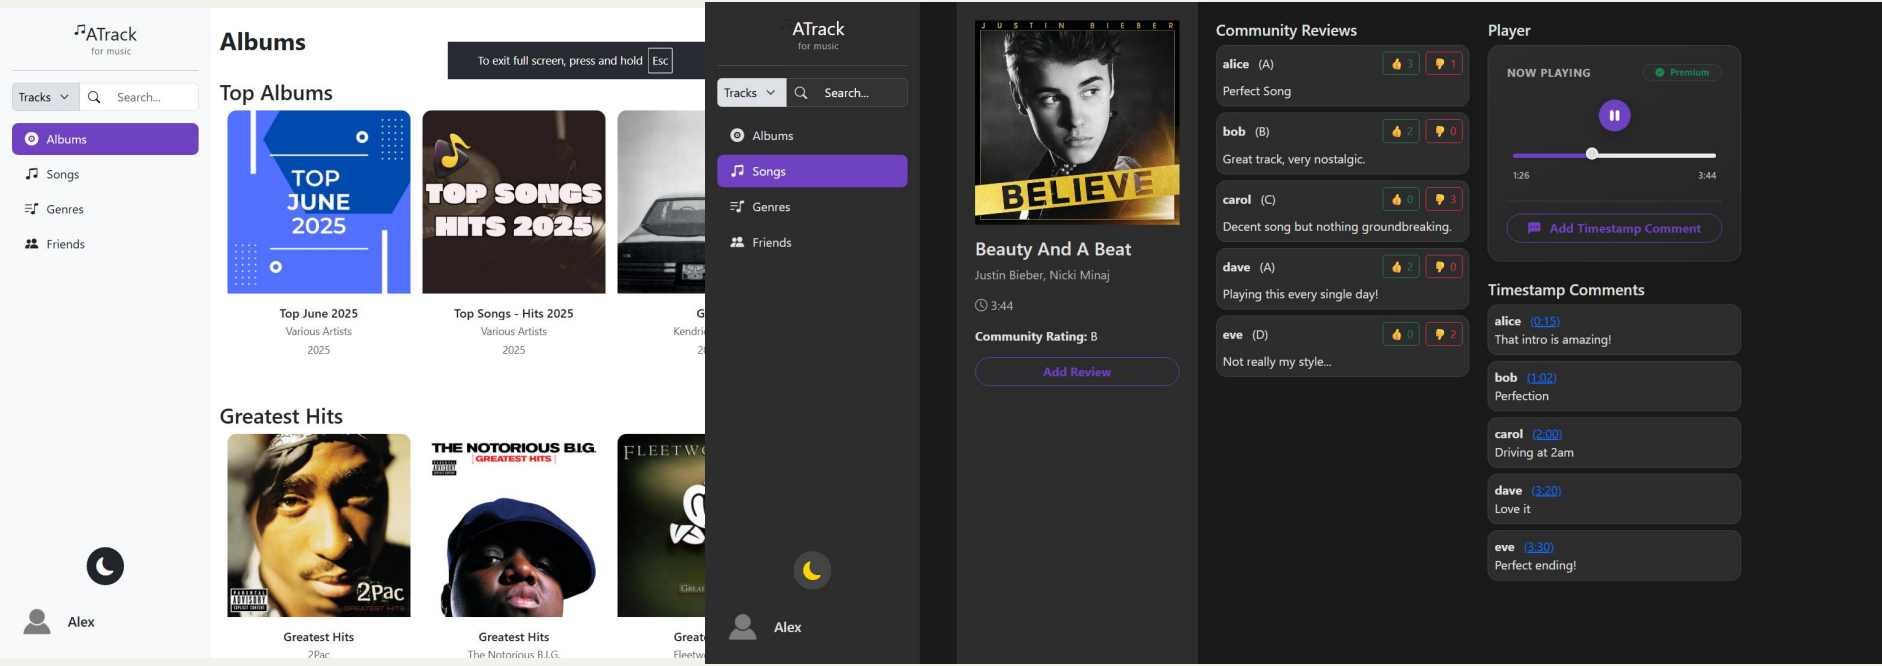
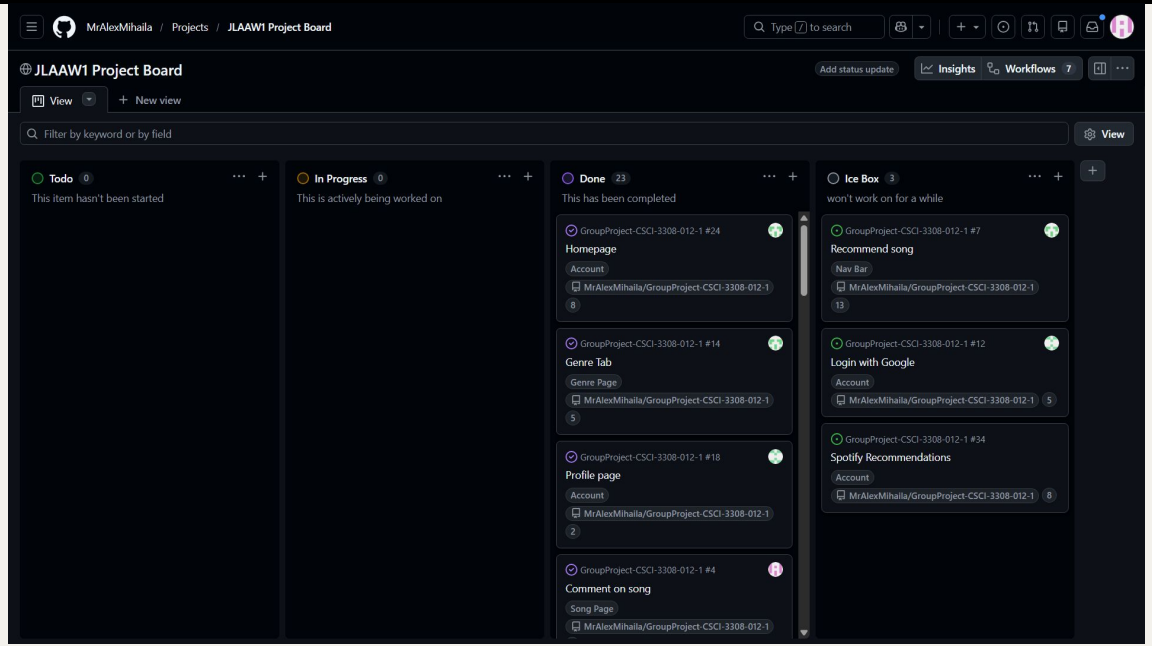
ATrack
Final Project Presentation

Luke McCord, Jonathan Stevenson, Andrew Fong, Alex Mihaila, William Brito



ATrack is a music review and social platform that aims to give users a unique and personal way to experience and discuss music. Users can grade their favorite songs and albums on an A-F scale and pair their ratings with written reviews to share their thoughts with the community. Users can provide feedback in the form of liking or disliking reviews, so its easy to tell who has horrible music taste. The home page keeps users plugged into everything happening around them, including trending songs and albums as well as real-time activity from friends and followed accounts, which both keeps you in the loop and provides a personalized experience. A search feature makes it easy to find any artist, album, song, or user on the platform. What sets ATrack apart from other review platforms is our timestamp comment system. Users who connect their Spotify Premium account can stream a track directly on the platform and leave comments at specific points in a song, allowing feedback to be tied to particular moments rather than the track as a whole.

Project Tracker



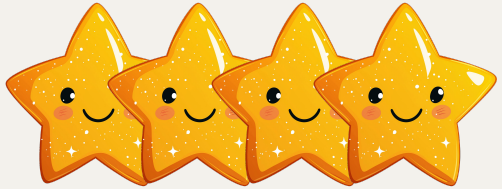
- Chose because it was easy and straight forward to use
- 4 out of 5 stars because we had issues with group members moving issues in the project board as they worked on them

VCS Repository

- Nothing much to say here
- 5 out of 5, we had no issues

GitHub

Database

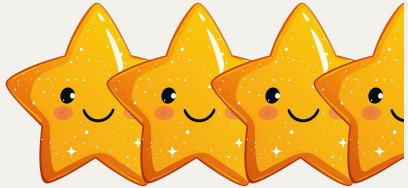


- Chose because we learned how to use it in lab
- Almost everything revolves around adding/manipulating data stored in databases
- Database for users, follows, comments, reviews, songs, albums, artists, genres, song to genre, album to genre, song to artist, album to artist
- Pretty easy to use once it was set up, hence why 4 out of 5 stars

IDE

- Chose because we were all familiar with it and it's easy to use
- 5 out of 5 stars, nothing else to say

UI Tools



- Handlebars is convenient
- HTML is tricky at first but fun after
- CSS was very annoying
- Figma for wireframes
- 3.5 out of 5 stars, mainly due to being annoyed with CSS

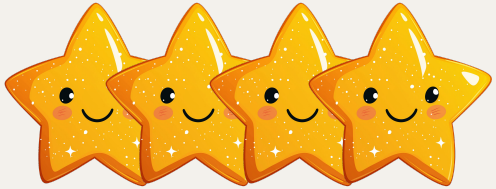
handlebars

HTML

Application Server

- Chose because it was easy to use
- 5 out of 5 stars, nothing else to say

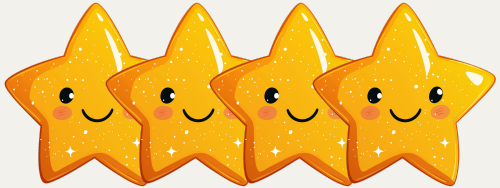
Deployment Environment

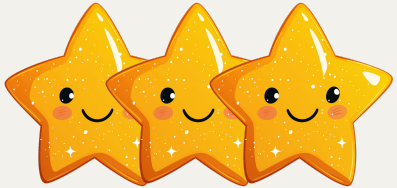


Render

- Chose to deploy website
- After setup, everything else was straight forward
- 4 out of 5 stars due to the setup being annoying

External APIs

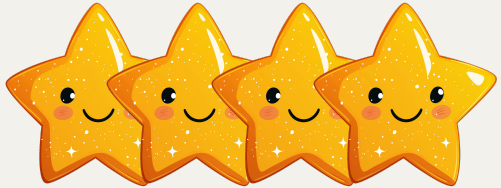




- Spotify Web API to connect to Spotify for data (Songs, albums, etc.)
- Spotify Web Playback SDK to connect to Spotify for the ability to have users listen to the songs they're looking at
- Web API is 4 out of 5 stars, mainly due to JSON issues
- Playback SDK is 3 out of 5 stars, due to how annoying it was to set up and the Spotify Premium limitation

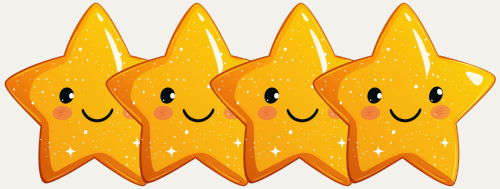
Cloud Image Storage

Cloudinary



- Used for Profile Picture Storage
- 4 out of 5 stars due to initial setup being annoying

Testing Tool



- Chose to use for our tests
- 4 out of 5 stars because it made local testing take longer

chai

MOCHA

Framework

express

- Handled all routing and middleware, very useful
- 5 out of 5 stars, nothing else to say

Project Management

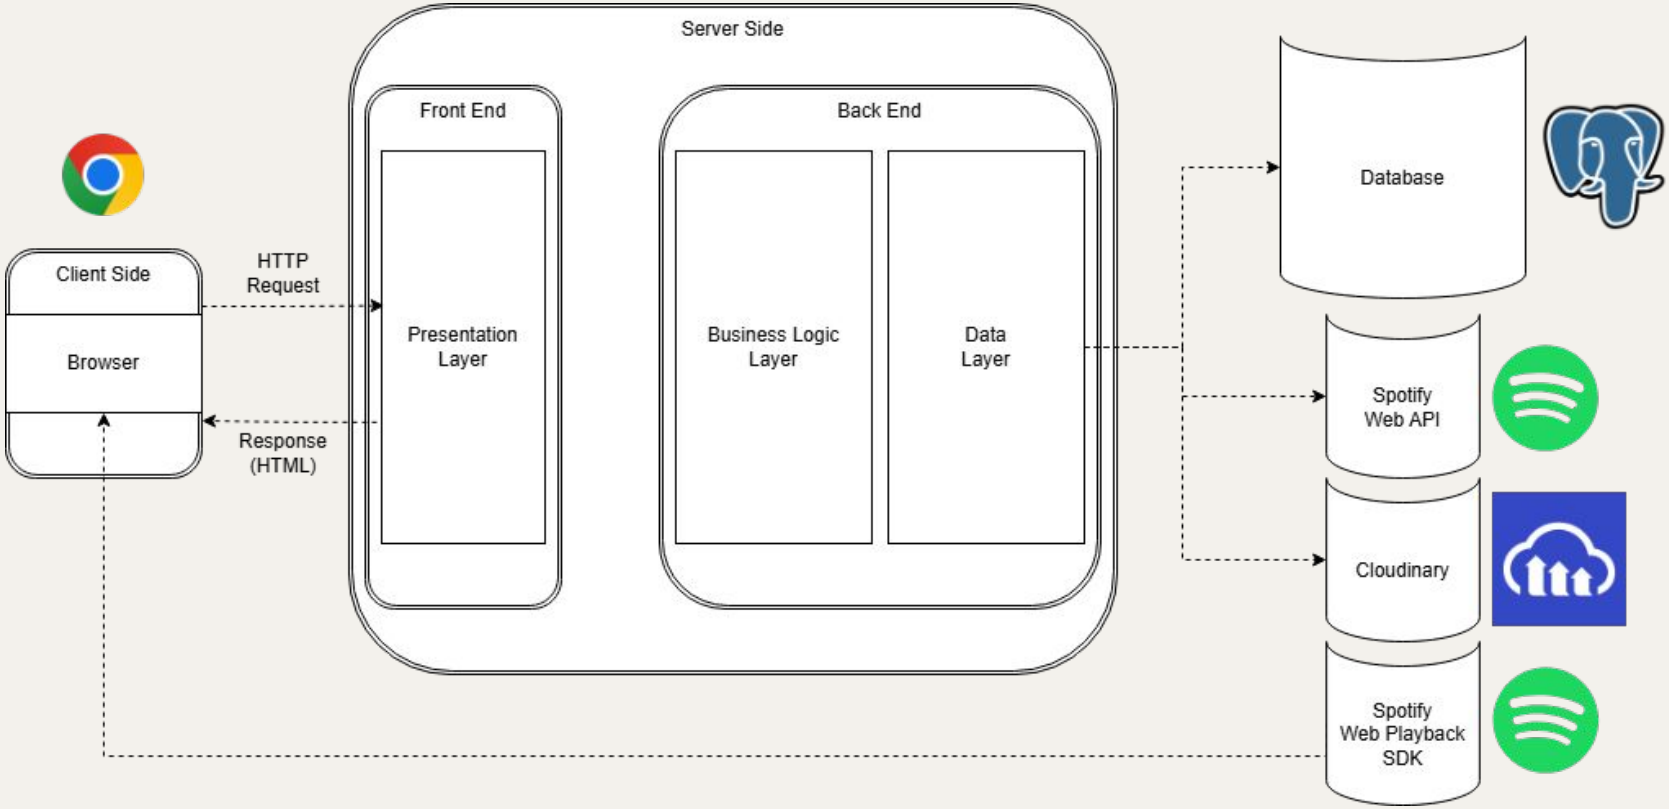
Agile

- USeful methodology we incorporated through the project
- 5 out of 5 stars, nothing else to say

Meetings

- Did group meetings at 3:30 every Tuesday discussing implemented features and next steps in accordance with Agile development
- Group evaluations done shortly thereafter on 3:45
- Frequent communication on Discord

Architecture Diagram



Challenges

- Lyrics
- Album Images
- Spotify Web Playback SDK

Future Plans

- Mobile Support
- Web Playback not requiring Spotify Premium (and thereby allowing all users to access the song timestamp feature, not just Spotify Premium users)
- Suggest music feature (Connect Spotify account and get recommended song suggestions based on Spotify listening history and ATrack ratings that you've done)
